

# Secunia Corporate Presentation

## Relevant, accurate vulnerability intelligence – at your fingertips

### Secunia's history

Secunia was inaugurated in 2002 as a reaction to the lack of vulnerability intelligence freely available to the public. From the first day of its founding until the present, Secunia has taken pride in providing the most accurate and most reliable vulnerability information to the world via our website and our vulnerability management tools.

### A world-class security research team

Today, Secunia is the world-leading provider of vulnerability intelligence and vulnerability management tools for the corporate IT infrastructure. We are a trusted and valued source of information, recognised by users, vendors, analysts, and press worldwide.

The vulnerability intelligence we provide is the result of the hard work generated daily by our world-class research team.

Our passion for this business is what has enabled Secunia to develop from tracking vulnerabilities the traditional way to being considered the most trusted vulnerability intelligence provider in the world. Our customers have a lot of confidence in our skills as researchers, whether it's checking to verify that a report from an independent researcher is valid, or when performing our own analysis of possible vulnerabilities in widely-used software.

### Secunia Vulnerability Management Series

The Secunia Vulnerability Management Series is the market-leading vulnerability management service that helps you control and organise all vulnerability issues in your network.

Through our highly acknowledged Secunia advisories, the Secunia Vulnerability Management Series enables you to track, filter, and eliminate vulnerabilities, while documenting the workflow and response to advisories and alerts.

The vulnerability management solutions are targeted at medium and enterprise customers, who lack the resources or internal competencies to monitor all relevant vulnerabilities. By outsourcing the tracking and filtering of vulnerabilities to Secunia, the IT department of your company can prioritise its resources and ensure complete control over the IT infrastructure.

### About Secunia

Secunia is the world-leading provider of vulnerability intelligence and vulnerability management tools for the corporate IT infrastructure.

We are an independent, unbiased provider of vulnerability alerts and advisories, free of all vendor ties. Secunia collects, evaluates, verifies, and analyses security information. This security information is available through our databases and distributed to our customers, segmented according to their specific business needs. We are a trusted and valued source of information, recognised by users, vendors, analysts, and press worldwide.

Our in-house security research team, consisting of experts specifically selected from hundreds of candidates worldwide for their unique competencies, performs the evaluation and analysis of the security information. This devotion to research and verification is what makes us stand out from the rest.

We listen to what our customers need - which is why each of our solutions has a unique market position:

- Secunia Vulnerability Management Series
- Secunia Binary Analysis
- Secunia Software Inspector Series

## Binary Analysis

Secunia's competence in vulnerability research is even more evident through our Binary Analysis program, available to our customers. Significant or high-profile vulnerabilities such as those disclosed in popular software or used by malware undergo in-depth analysis at the hands of our security research experts, resulting in comprehensive and thorough documentation of the issue. Secunia research experts are also adept at constructing proof-of-concept or exploit codes for the vulnerabilities, allowing customers to develop more accurate detection signatures.

*"The Secunia Binary Analysis Service is a great way for customers to save time and money in an industry where incident response accuracy is the most important parameter. All they have to do is read our analysis to be able to develop more accurate AV and IDS signatures. Then they can use our exploit or proof-of-concept code to verify their signatures. It's an efficient and highly reliable way for them to maximise their own capabilities and expertise."*

*Thomas Kristensen, CTO of Secunia*

## Secunia Software Inspector Series

The Secunia Software Inspector Series is based on our unique vulnerability scanning technology, which automates a large part of the vulnerability management process by eliminating the uncertainty of what vulnerabilities are located in which client applications on your network. Our current solutions in this series include a commercial network edition called the Secunia CSI (Corporate Software Inspector) for users with more than one host, and a free consumer version called the Secunia PSI (Personal Software Inspector).

*"With the invention of the Software Inspector Series, Secunia has taken a major leap in fulfilling our vision of delivering user-friendly vulnerability management solutions to the market. The scalability of our solutions, combined with special enterprise features, enables us to offer a unique value proposition to both the SOHO market as well as the global enterprise market."*

*Niels Henrik Rasmussen, CEO of Secunia*

## Commitment

Secunia is dedicated to fighting vulnerabilities to improve online security for everyone. Secunia believes that this can only be achieved through full disclosure of security issues, and by promoting the necessity of patching insecure applications.

This is the primary motivation for offering the Secunia PSI to private individuals and maintaining the secunia.com website as reference for users and independent researchers.

## Selected customers

## Contact Secunia

Secunia engages in partnerships worldwide in relation to selling OEM/ODM versions of our Software Inspector Series as well as with regard to strategic alliances and reselling agreements.

Please contact [partners@secunia.com](mailto:partners@secunia.com) for further information on partnership options.
