

# Secunia Vulnerability Intelligence Feed

## Centralise your vulnerability handling

**"Enterprises are focused on correlating threats to vulnerabilities, formulating all the data produced from various threat management tools so they can make meaningful decisions about mitigating threats... Indeed, a majority of survey participants cite correlating threats and vulnerabilities as their top vulnerability management challenge."**

*Information Security Magazine, February 2009*

### Filter, track, eliminate

The Secunia Vulnerability Intelligence Feed (VIF) is the one-source solution that provides IT security departments with the latest vulnerability intelligence: Filtered, verified, and analysed with information on patches and workarounds, easy to distribute within the organisation. The VIF is specifically relevant for organisations with an internal CERT/CSIRT division which assesses all security issues or with a centralised security department responsible for delivering vulnerability intelligence internally through asset management tools or other distribution channels.

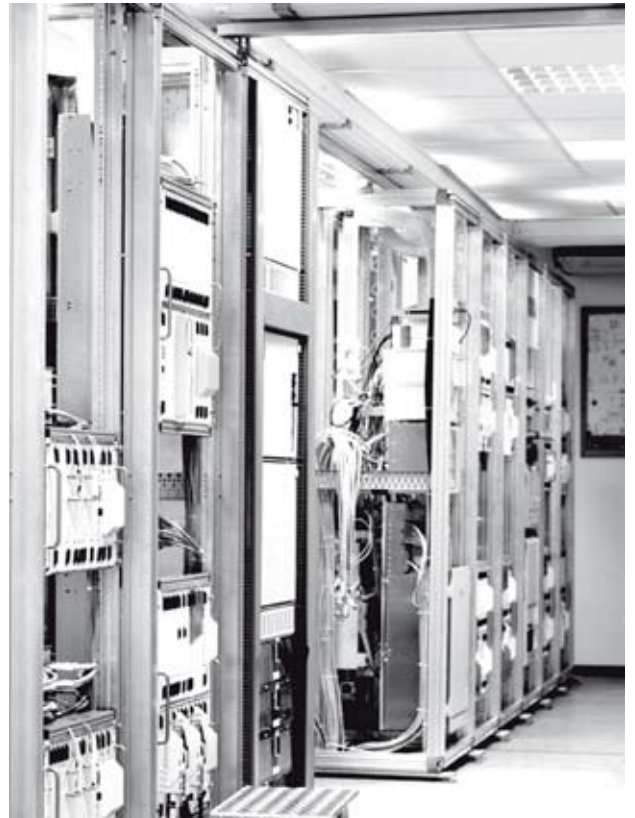

### Trusted, unified, and vendor-independent

The VIF solution is the market-leading vulnerability service that helps you control your vulnerability issues. Through our highly acknowledged Secunia advisories, the VIF solution enables you to filter, track, and eliminate vulnerability issues in a highly efficient manner.

As a large organisation, you may need to monitor vulnerabilities for thousands of systems and applications. This is not feasible without a trusted, unified, and vendor-independent source that covers the largest available spectrum of systems and applications. Secunia is currently monitoring in excess of 20.000 systems.

The VIF obtains its vulnerability information from the most accurate source available: The highly regarded Secunia Advisory Database. Each advisory is verified and written by a Secunia Research expert and provides you with all the necessary information to understand the issue, allowing you to make your own informed decisions on how to handle the threat.

Secunia Research experts routinely collect information from various websites, mailing lists, news groups, vendors, and other security researchers as well as conduct their own in-house research. This information is then verified and validated.

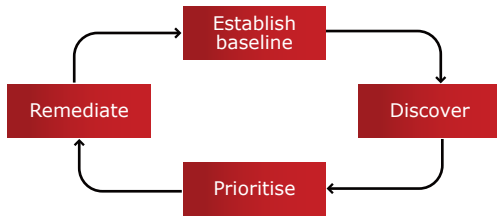

### Corporate summary

Today, Secunia has a professional organisation of IT researchers, software developers, and salespeople working with global enterprises and industry partnerships. We are present at major conferences in North America, members of FIRST, GSA approved to work with US governments, and generally recognised as *the* vulnerability intelligence provider.

- Started in 2002
- Profitable in all fiscal years
- Privately held - no external funding
- Expanding our business with new HQ and hirings in Research, Development, and Sales
- Recognised worldwide
- Awarded as one of the three best start-up businesses in Denmark in 2006
- 5 million website users

### How does it work?

Getting started using VIF is very easy. You can immediately register the system/application environment you want to track as well as how the various profiles need to receive the intelligence. The VIF can handle multiple profiles and filter intelligence in accordance with your requirements and specifications.

### What are the benefits?

With your VIF solution you will be able to:

- Set up filtering criteria according to product categories used across your entire infrastructure
- Import an existing inventory list of any format, thus ensuring that only relevant intelligence is received
- Receive intelligence/alerts in your chosen format: E-mail, SMS or XML-feed
- Direct access to Secunia Research for expert dialogue and continued support on vulnerability issues

The VIF thereby provides you with a service especially designed for the professional organisation, which appreciates the value of receiving vulnerability intelligence from one primary and reliable source.

### Features of the Secunia Vulnerability Intelligence Feed - Enterprise Edition

#### Vulnerability alerts & advisories

Detailed description provides:

- The type of issue
- Risk rating
- Category
- Summary of vulnerability and recommended patch or workaround solutions
- Advisories written in a uniform manner, rated according to Secunia's highly acknowledged assessment scale
- Alerts issued via SMS to ensure instant notification on critical vulnerabilities
- Advisories with full details sent via e-mail
- The option of setting your own threshold levels for when you want to be alerted

#### Details

- Security intelligence updated continuously
- Multiple profiles (optional)
- Security advisories are analysed, verified, evaluated and rated by Secunia experts

The assessment is based on:

- Requirements to exploit, availability of exploit code
- Ease of exploitation (could it be exploited by a worm, or does it require social engineering/human error?)
- Attack vector
- Type of software/services (is it typically used on Internet, or only internal networks?)
- Impact of "successful" exploitation
- Availability of patch/complexity of alternative workaround
- The most comprehensive vulnerability monitoring on the market
- Available as XML feed
- Multi-user capability
